For:

INDIVIDUALIZED, LOCATION SPECIFIC WEATHER

FORECASTING SYSTEM

- 1 1. A forecasting subsystem comprising:
- 2 an ingest processor programmed to receive weather data unique to
- 3 specific geographic sectors;
- 4 a prediction processor, responsive to the ingest processor,
- 5 programmed to predict the weather for each sector as a function of time;
- a server programmed to receive a request from an electronic device
- 7 and location information for said electronic device; and
- 8 a sector processor programmed to provide, to the server, weather
- 9 predictions for the sector corresponding to the location information.

1	2. A weather forecasting method comprising:
2	receiving weather data unique to specific geographic sectors;
3	in response to the received weather data, predicting the weather for
4	each sector as a function of time;
5	receiving a request from electronic device and location information
6	from said electronic device;
7	providing weather predictions for the sector corresponding to the
8	location information; and
9	transmitting said weather predictions to the electronic device.

Weather forecast data transmitted to and displayed on a cellular telephone.

4. Weather forecast data transmitted to and displayed on a mobile electronic device.
